

The Sutton Academy

# Knowledge Rich Curriculum Plan

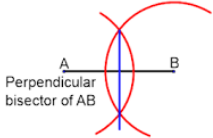

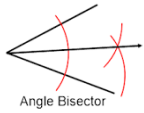

Year 11 Higher – Geometry 1

Lesson/Learning Sequence	Intended Knowledge: <i>Students will know that...</i>	Tiered Vocabulary	Steps To Success	Prior Knowledge: <i>In order to know this, students need to already know that...</i>	Feedback
To learn how to calculate interior and exterior angles	<ul style="list-style-type: none"> <li>Students will know how to calculate the size of an interior angle for a regular or irregular polygon using the formula for the sum of the interior angles: <math display="block">(n - 2) \times 180</math></li> <li>Students will know how to calculate the size of an exterior angle of a polygon using the calculation <math>360/\text{number of sides}</math>.</li> <li>Students will know that the interior and exterior angle add to 180</li> <li>Students will know how to apply the rules for finding interior and exterior angles to solve multi-step problems involving both regular and irregular polygons</li> <li>Students will know how to determine the number of sides for a polygon using the exterior angle</li> </ul>	<p><b>Interior</b> – Inside</p> <p><b>Exterior</b> – Outside</p> <p><b>Exterior angle</b> – is the angle between a side of a polygon and an extended adjacent side.</p> <p><b>Polygon</b> – a closed shape with straight sides</p> <p><b>Regular Polygon</b> – A polygon where all sides are the same length and all angles are equal</p> <p><b>Irregular Polygon</b> – A polygon where all sides are the same length and all angles are not equal</p> <p><b>Tessellate</b> – fit together without gaps or overlapping.</p>	<p><b>Steps to Success – Interior angles of a regular polygon</b></p> <p><b>Step 1:</b> Check that you shape is regular. Does it have equal sides and equal angles?</p> <p><b>Step 2:</b> Calculate the sum of the interior angles by using the formula: <math display="block">\text{Sum of the interior angles} = (n - 2) \times 180</math></p> <p>Where, n, is the number of sides.</p> <p><b>Step 3:</b> Divide this sum by how many equal angles the polygon has.</p> <p><b>Steps to Success – Missing angle of an irregular polygon</b></p> <p><b>Step 1:</b> Check that you shape is irregular. Not all the sides or angle are equal.</p> <p><b>Step 2:</b> Calculate the sum of the interior angles by using the formula: <math display="block">\text{Sum of the interior angles} = (n - 2) \times 180</math></p> <p>Where, n, is the number of sides.</p> <p><b>Step 3:</b> Add up all the known angles.</p> <p><b>Step 4:</b> Subtract the sum of the known angles from the sum of the interior angles to find the missing angle.</p>	<ul style="list-style-type: none"> <li>Students need to know the basic angle facts</li> <li>Students need to know how to calculate missing angles in triangles and quadrilaterals</li> </ul>	
To learn how to find missing angles in parallel lines	<ul style="list-style-type: none"> <li>Students will know how to identify alternate, corresponding and co-interior angles</li> <li>Students will know that corresponding angles are equal</li> <li>Students will know that alternate angles are equal</li> <li>Students will know that co-interior angles add to 180</li> <li>Students will know how to find missing angles in parallel lines and give clear reasons for their answers</li> </ul>	<p><b>Parallel</b> – parallel lines are two lines that are side by side and have the same distance continuously between them</p> <p><b>Isosceles Triangle</b> – a triangle with two equal sides and two equal angles</p> <p><b>Corresponding</b> – matching</p>	<p><b>Alternate angles</b></p> <p><b>Alternate angles</b> are two angles, formed when a line crosses two other lines, that lie on opposite sides of the transversal line and on opposite relative sides of the other lines. If the two lines crossed are parallel, the alternate angles are equal.</p> <p><b>Alternate angles</b> are equal.</p>  <p><b>Corresponding angles</b></p>	<ul style="list-style-type: none"> <li>Students should already know that vertically opposite angles are equal</li> <li>Students should already know how to calculate missing angles in triangles, including equilateral and isosceles triangles</li> <li>Students should already know that angles on a straight line add to 180</li> </ul>	

Lesson/Learning Sequence	Intended Knowledge: <i>Students will know that...</i>	Tiered Vocabulary	Steps To Success	Prior Knowledge: <i>In order to know this, students need to already know that...</i>	Feedback
		<p><b>Co-interior Angles</b> – angles that lie between two lines and on the same side of a transversal</p> <p><b>Transversal</b> – a line that crosses at least two other lines</p>	<p><b>Corresponding angles</b> are angles that occur on the same side of the transversal line and are equal in size. They are either both obtuse or both acute. <b>Corresponding</b> means matching. <b>Corresponding angles</b> are equal.</p>  <p><b>Co-interior angles</b> <b>Co-interior angles</b> are angles on the same side of the transversal and inside the parallel lines. The two angles that occur on the same side of the transversal always add up to 180°. <b>Co-interior</b> angles add up to 180°.</p>		
To learn how to measure and draw bearings	<ul style="list-style-type: none"> <li>Students will know the rules for bearings;               <ol style="list-style-type: none"> <li>1) Always measure from North</li> <li>2) Bearings must be written as 3 digits.</li> <li>3) Always measure in a clockwise direction.</li> </ol> </li> <li>Students will know how to use a protractor to accurately draw bearings from A to B and B to A.</li> <li>Students will know how to use a protractor and ruler to accurately measure bearings on a map, including measuring from A to B and B to A.</li> <li>Students will know how to accurately draw and measuring bearings using a protractor to solve problems</li> <li>Students will know how to use the angle properties of parallel lines to determine bearings</li> </ul>	<p><b>Bearing</b> – angles, measured clockwise from north</p>	<p><b>Steps to Success- Measuring bearings</b>  <b>Step 1:</b> Draw a line connecting the two points unless this has been drawn for you.  <b>Step 2:</b> Identify which point you are measuring the bearing <b>from</b>.  <b>Step 3:</b> Place the protractors centre on the bottom of the line with 0 on the <b>North</b> line.  <b>Step 4:</b> Measure the size of the angle, remembering to measure <b>clockwise</b>.  <b>Step 5:</b> Record your bearing, ensuring it has 3 digits. If the angle is less than 100, place a zero as the first digit.</p> <p><b>Steps to Success- Drawing bearings</b>  <b>Step 1:</b> Identify which point you are drawing the bearing <b>from</b>.  <b>Step 2:</b> Draw the North line at that point unless it has been drawn for you.  <b>Step 3:</b> Place the protractors centre on the bottom of the line with 0 on the <b>North</b> line.  <b>Step 4:</b> Measure the angle in the question, remembering that bearings are measured <b>clockwise</b>.  <b>Step 5:</b> Make a marking at the position of the angle, then draw through the point to the required measurement as given in the</p>	<ul style="list-style-type: none"> <li>Students should already know how to measure and draw angles</li> <li>Students should know how to calculate angles in parallel lines using the fact that co-interior angles add to 180</li> </ul>	<ul style="list-style-type: none"> <li></li> </ul>

			question.		
To learn how to construct angles and bisectors	<ul style="list-style-type: none"> <li>• Students will know how to construct a perpendicular bisector of any given line</li> <li>• Students will know how to construct a perpendicular from a point to a line.</li> <li>• Students will know how to construct a bisector of any given angle.</li> <li>• Students will know how to accurately construct angles including <math>45^\circ</math> and <math>90^\circ</math>.</li> <li>• Students will know that the perpendicular distance from a point to a line, is the shortest distance to the line.</li> </ul>	<p><b>Perpendicular</b> – at a right angle to</p> <p><b>Bisect</b> – cut into two equal parts</p> <p><b>Bisector</b> – A line that splits an angle or line into two equal parts</p>	<p><b>Steps to Success- Constructing perpendicular bisectors</b></p> <p><b>Step 1: Use compasses to draw an arc.</b> Open the compasses to about three-quarters of the length of the line. Put the point of the compasses on one of the endpoints of the line. Draw an arc.</p> <p><b>Step 2: Use the compasses to draw a second arc, intersecting the first arc.</b> Keeping the compasses, the same, draw another arc from the other end of the line.</p> <p><b>Step 3: Join the two points where the arcs intersect.</b> Using a ruler, join up the two points where the arcs intersect each other. The new line is the perpendicular bisector of the original line segment <math>AB</math>.</p> <p><b>Step 4: Check.</b> You can check that the new line goes through the midpoint of the line segment <math>AB</math> by using a ruler to measure. The line <math>AB</math> should have been cut into two equal halves. You can also check if the lines meet at a right angle.</p> <p><b>Steps to Success- Constructing angle bisectors</b></p> <p><b>Step 1: Use compasses to draw an arc.</b> Set your compasses to a length that is less than the shortest line. Putting the point of the compasses on <math>B</math>, draw one arc going through both <math>AB</math> and <math>BC</math>.</p> <p><b>Step 2: Use the compasses to draw two more arcs.</b> Put the point of the compasses on the point where the first arc crossed <math>AB</math> and draw an arc. Keep the compass on the same setting. Repeat by putting the point</p>	<ul style="list-style-type: none"> <li>• Students should already know how to measure the length of a line using a ruler</li> </ul>	<ul style="list-style-type: none"> <li>•</li> </ul>

			<p>of the compasses on the point where the first arc crossed <math>BC</math> and draw an arc. These two arcs need to intersect.</p> <p><b>Step 3: Join the vertex with the point where the arcs intersect.</b> Using a ruler, join up the point where the arcs intersect each other with the vertex <math>B</math>. The new straight line is the angle bisector of the original angle <math>ABC</math> and splits it into two equal parts.</p> <p><b>Step 4: Check.</b> You can check that the new straight line bisects the angle <math>ABC</math> by using a protractor.</p> <p><u><b>Steps to Success- Constructing a perpendicular line to a point</b></u></p> <p><b>Step 1: Draw two arcs crossing the line segment.</b> Put the point of the compasses on the original point <math>P</math>. Draw an arc that crosses the original line in two places. These are labelled <math>A</math> and <math>B</math>.</p> <p><b>Step 2: Make two more arcs which intersect.</b> Put the point of the compasses on point <math>A</math> where an arc crosses the line and draw another arc. Keep the compasses on the same setting. Repeat with point <math>B</math>, drawing another arc to intersect the arc just drawn.</p> <p>• <b>Step 3: Join the point where the arcs intersect to the original point.</b> Using a ruler, join up the point where the arcs intersect each other and the original point <math>P</math>. The new line is perpendicular to the original line segment. The new line will have also bisected the length <math>AB</math> – this may not be true for all questions.</p> <p><b>Step 4: Measure the line.</b> You may be asked to measure the shortest distance from the point to the line. To do this measure the line you have constructed.</p>
