The Sutton Academy

Knowledge Rich Curriculum Plan

Year 9 Support – Ratio and Proportion

Lesson Objective	Intended Knowledge:	Tiered Vocabulary	Prior Knowledge:	Steps to Success	Feedback
To learn how to write, simplify and compare ratio	• Students will know how to express a situation in a ratio • Students will know how to write a ratio in its simplest form • Students will know how to simplify ratios in the form of 1 : n or n : 1. • Students will know how to convert fractions into ratios and vice versa. • Students will know how to represent a ratio using boxes or bars **Opportunity for challenge:** • Students will know how to compare ratios by converting to fractions.	**Ratio** - a way of representing the relationship between two amounts **Simplify –** make something simpler or easier to manage **Cultural capital**	• Students need to know how to find the HCF od two numbers.	**Steps to Success – Expressing as a Ratio** Step 1 – Read the question, it is important to identify which order the question is asking you order the values. Step 2 – Express the values in the question as a ratio. Step 3- If possible, and the question requires you to, simplify. **Simplifying ratio - Steps to Success** **Step 1:** Find the highest common factor of the numbers. **Step 2:** Divide both numbers by the highest common factor. **Step 3:** Always double check that your answer has no common factors left in it. **Step 4:** If you have any commons factors left then repeat steps 1, 2 and 3. (This may happen if you didn't the highest possible common factor in step 1.) **Simplifying ratio - Steps to Success** **Step 1:** Place the number 1 under the same side of the ratio. **Step 2:** How did you get from the number in your ratio to 1? (This is probably a divide!) **Step 3:** To keep the ratio equivalent, you must do the same calculation to the other side of the ratio. This may come out as a decimal. **Steps to Success – How do we compare ratios?** **Step 1**: Express the ratios as a fraction **Step 2**: Find the common denominator of the two fractions, either find the lowest common multiple (LCM) of the two denominators or use the product of the two denominators. **Step 3**: Once you have chosen your common denominator you have to ensure you keep the fractions equivalent to the original fractions in the question. This means that whatever you have done to the denominator of the original fraction, you must also do the to numerator. For example if you multiplied the denominator of a fraction by 5, you must also multiply the numerator by 5. **Step 4**: Identify what the question is asking you for, e.g. the smaller or larger proportion	
To learn how to share an amount into a ratio	• Students will know how to share a quantity into a two-part given ratio. • Students will know how to share a quantity into a three-part given ratio. • Students will know how to find quantities within a ratio when the value of one part is given. **Opportunity for challenge:**	**Share** – split up between parts	• Students need to know how to use the bus stop method. • Students will know how to represent a ratio using boxes or bars •	**Steps to Success - How do we share in a given ratio?** **Step 1:** Firstly, represent the ratio in the form of boxes – remember to assign the ratio in the order of the question. **Step 2:** Count the number of the parts within the question. Divide the total amount by the number of parts. This will give you the amount that each part is worth. **Step 3:** Write the value of each part within the box and calculate the totals for each section of the ratio.	

Lesson Objective	Intended Knowledge:	Tiered Vocabulary	Prior Knowledge:	Steps to Success	Feedback
	• Students will know how to find quantities within a ratio when the difference between two parts is given.			**Step 4:** Check if the question is asking to share between a ratio or for a specific value within the ratio. **Steps to Success: Ratio - Given one value** Step 1: Firstly, represent the ratio in the form of boxes – remember to assign the ratio in the order of the question. Step 2: If you are given one value divide the amount by the number of parts for the person it is referring to. Step 3: Write the value of each part within the box and calculate the totals for each section of the ratio. Step 4: Check if the question is asking for one value or for the total amount. **Steps to Success Ratio – Given the difference** Step 1: Firstly, represent the ratio in the form of boxes – remember to assign the ratio in the order of the question. Step 2: Count the difference in the number of the parts within the question. Divide the difference by the difference in the number of parts. This will give you the amount that each part is worth. Step 3: Write the value of each part within the box and calculate the totals for each section of the ratio. Step 4: Check if the question is asking for one value or for the total amount.	
To learn how to scale up recipes	• Students will know how to scale up simple recipes. E.g. take a recipe for two people and make it for four people or take a recipe for 8 people and make it for 2 people etc. • Students will know how to scale up recipes involving more than 1 step. E.g. take a recipe for 4 people and make it for 10 people. **Opportunity for challenge:** • Students will know how to scale up recipes involving scaling down to 1 and multiplying by the amount needed for the new recipe.	**Proportion –** the relationship between two things where the change of one will have a direct or inverse change on another **Direct Proportion –**if one number increases, then so does the other or if one decreases then so does the other	• Students need to know how to multiply and divide integers.	**Steps to Success – How do you scale up/down recipes?** To begin you need to **Identify** whether the ingredients in the recipe are being scaled up or down, if the new amount is bigger it is scaling up, if it is smaller you are scaling down. There are **multiple** methods that can be carried out to find the ingredients for the new recipe: **Method 1**: Find the ingredients **required** if the recipe was for one person, to do this divide the ingredients by the amount the recipe is made for. E.g. If the recipes was for 6 people, divide by 6. Once you have achieved this multiply it by the amount the recipe is now for. **Method 2**: **Express** the ingredient you are trying to find as a ratio with the amount the recipe shows. **Simplify** to find the amount required for one. Then multiply by the amount needed. **Method 3**: Find the recipe for a **common factor** of people, and then scale up.	

Lesson Objective	Intended Knowledge:	Tiered Vocabulary	Prior Knowledge:	Steps to Success	Feedback
To learn how to identify best buys	• Students will know how to find the best buy by either finding the value of one item for each option or finding the value of a common multiple of each item.	**Value** – how much money something is worth	• Students need to know how to find the LCM of two numbers.	**Steps to Success – Comparing prices to find the best buy** **Method 1 – Finding the price of one item and comparing.** **Step one: Identify** if you are being asked to **compare** prices or find the **cheapest** option, if so do the following. **Step two:** You need to compare the price, this can be done by dividing the price by the **quantity** you have of each item. This will give you the cost for 1 unit of that item. **Step three:** Compare the prices for each **unit**, the lowest price is the best buy. **Step four:** Identify what the question is asking you for, is it asking for the cheapest item? Remember to write the name of the cheapest item and give your **reasoning**. Do not circle which is cheapest. **Method 2 – Finding the LCM of each item and comparing.** **Step one:** Identify if you are being asked to compare prices or find the cheapest option, if so do the following. **Step two:** You need to find the lowest common multiple (LCM) of the quantities of each item. **Step three:** Multiply the cost of each item in order to get the LCM quantity of each item, this is so you can compare. **Step four:** Compare the prices for each item, the lowest price is the best buy. **Step five:** Identify what the question is asking you for, is it asking for the cheapest item? Remember to write the name of the cheapest item and give your reasoning. Do not circle which is cheapest.	
To learn how to convert currencies	• Students will know how to convert between different currencies. **Opportunity for challenge:** • Students will know how to solve simple problems involving the conversions of different currencies.	**Currency** – a system of money in general use in a particular country. **Convert –** change a value from one form to another	• Students need to know how to multiply and divide by decimals.	**Currency Conversion** Step one – Write out the conversions and label with arrows. Step two – Decide which direction involves multiplication and label this arrow. Step three – Decide which direction involves division and label this. Step four – Use the diagrams to convert appropriately. (When multiple conversions are needed work through those one at a time.)	
Mini-Assessment 7
